Semantics of colours:

Blue = “Standard” Mathematics

Red = Constructive, effective,
algorithm, machine object, ...

Violet = Problem, difficulty, obstacle, disadvantage, ...

Green = Solution, essential point, mathematicians, ...

Three solutions for **Constructive Algebraic Topology**:

1. **Rolf Schön** (**Inductive methods**).
2. **Effective Homology**.
3. **Operadic Algebraic Topology**.

Only the second one so far

led to **concrete computer programs**.

Plan of the talk: 1. **Computer** illustration

around **CW-complexes**.

2. **Constructive** statement of

the **homological problem**.

3. Other **computer** illustrations.

Attaching a cell D^n to a topological space X

along the boundary S^{n-1} :

$X =$ Topological space.

$f : S^{n-1} \rightarrow X =$ continuous map.

$\Rightarrow X \cup_f D^n := (X \amalg D^n) / (X \ni f(x) \sim x \in S^{n-1})$.

Notion of CW-Complex X :

$$X = \varinjlim \{X_0 \subset X_1 \subset X_2 \subset X_3 \subset \cdots \subset X_n \subset \cdots\}_{n \in \mathbb{N}}$$

with $X_0 =$ discrete space and

the n -skeleton X_n is obtained

from the $(n - 1)$ -skeleton X_{n-1}

by attaching n -disks D_1^n, D_2^n, \cdots to X_{n-1}

according to attaching maps f_1^n, f_2^n, \cdots

Every reasonable space can be presented

up to homotopy equivalence

as a CW-complex of finite type.

Example 1. Presentation of $X = P^2\mathbb{R}$ as a CW-complex.

$$X_0 = *$$

$$D^1 \supset S^0 \xrightarrow{f^1} *$$

$$\Rightarrow X_1 = X_0 \cup_{f^1} D^1 = X_1 = S^1 = \{Z \in \mathbb{C} \text{ st } |z| = 1\}$$

$$D^2 \supset S^1 \xrightarrow{f^2} S^1 : z \mapsto z^2$$

$$\Rightarrow X = X_2 = X_1 \cup_{f^2} D^2 = P^2\mathbb{R}$$

Example 2. More generally:

Presentation of $X = P^\infty\mathbb{R}$ as a CW-complex.

1. $X_0 = P^0\mathbb{R} = S^0/\sim = *$.

2. Let us assume $X_n = P^n\mathbb{R}$ constructed.

3. $D^{n+1} \supset S^n \xrightarrow{f^{n+1}} P^n\mathbb{R}$

with $f^{n+1} =$ the canonical projection.

4. $\Rightarrow X_{n+1} = D^{n+1} \cup_{f^{n+1}} X_n = P^{n+1}\mathbb{R}$.

(++ n) ; goto 2.

5. $X = \lim_{\rightarrow} X_n = P^\infty\mathbb{R}$.

Example 3. **Simplicial complexes and simplicial sets.**

X = simplicial set.

Definition: The **n -skeleton** X_n of X is obtained from X by keeping the **non-degenerate simplices of dimension $\leq n$** (and their degeneracies), throwing away the **non-degenerate simplices of dimension $> n$** (and their degeneracies).

$|X_n|$ obtained from $|X_{n-1}|$

by attaching n -simplices = n -disks.

$\Rightarrow X = \text{CW-complex}$ with $|X| = \lim_{\rightarrow} |X_n|$.

Simplicial version of $P^\infty\mathbb{R}$:

$$P^\infty\mathbb{R} = X = K(\mathbb{Z}_2, 1)$$

$$\Rightarrow X_n^{ND} = \{\sigma_n\}$$

$$\begin{aligned} \partial_i \sigma_n &= \sigma_{n-1} \text{ if } i = 0, n; \\ &= \eta_{i-1} \sigma_{n-2} \text{ if } 0 < i < n. \end{aligned}$$

$$\Rightarrow C_* X = \{\dots \xleftarrow{0} \mathbb{Z} \xleftarrow{0} \mathbb{Z} \xleftarrow{\times 2} \mathbb{Z} \xleftarrow{0} \mathbb{Z} \xleftarrow{\times 2} \mathbb{Z} \xleftarrow{0} \mathbb{Z} \xleftarrow{\times 2} \mathbb{Z} \xleftarrow{0} \mathbb{Z} \xleftarrow{\times 2} \dots\}$$

$$\begin{aligned} \Rightarrow H_i(P^\infty\mathbb{R}) &= \mathbb{Z} \text{ if } i = 0; \\ &\mathbb{Z}_2 \text{ if } i > 0 \text{ odd;} \\ &0 \text{ if } i > 0 \text{ even.} \end{aligned}$$

The same for $P^\infty\mathbb{C}$?

Topological version ? **Easy**.

$P^\infty\mathbb{C} = X = \lim_{\rightarrow} X_{2n}$ where:

$$X_{2n} = X_{2n-2} \cup_{f^{2n}} D^{2n}$$

with: $D^{2n} \supset S^{2n-1} \rightarrow P^{n-1}\mathbb{C}$ the canonical projection.

Simplicial version?

Much harder!

Easy up to homotopy.

Easiest solution = $K(\mathbb{Z}, 2)$.

Justification = two principal fibrations:

$$S^1 \hookrightarrow S^\infty \longrightarrow P^\infty \mathbb{C}$$

$$K(\mathbb{Z}, 1) \hookrightarrow E(\mathbb{Z}, 1) \longrightarrow K(\mathbb{Z}, 2)$$

+ $(K(\mathbb{Z}, 1) \sim S^1)$ + $(S^\infty \text{ contractible})$ + $(E(\mathbb{Z}, 1) \text{ contractible})$

$$\Rightarrow P^\infty \mathbb{C} \sim K(\mathbb{Z}, 2)$$

Remark: $K(\mathbb{Z}, 2)$ not of finite type!

Simplicial model of finite type for $P^2 \mathbb{C}$??

Cellular homology.

$S^n = S^1 \times D^{n-1} / \sim$ with $(z, x) \sim (z', x')$ if $x = x' \in \partial D^{n-1}$.

Canonical self-map of degree k for S^n :

$$\alpha_k : S^n \rightarrow S^n : (z, x) \mapsto (z^n, x).$$

Theorem (Hopf): $\mathcal{C}(S^n, S^n) / \sim \cong \mathbb{Z}$.

CW-complex:

$$X = \varinjlim X_n = \{(D_i^n, f_i^n : S^{n-1} \rightarrow X_{n-1})_{1 \leq i \leq m_n}\}_{n \in \mathbb{N}}$$

Associated cellular chain complex:

$$\dots \longleftarrow \mathbb{Z}^{(m_{n-1})} \xleftarrow{d_n} \mathbb{Z}^{(m_n)} \longleftarrow \dots$$

Coefficient $\alpha_{1,1}$ of d_n in column 1 and row 1

obtained from $g_{1,1}^n$:

$$f_1^n : S^{n-1} \rightarrow X^{n-1}$$

$$\Rightarrow g_{1,1}^n : S^{n-1} \rightarrow Y_1^{n-1} = X^{n-1} / [X^{n-2} \cup (\cup_{i \neq 1} D_i^{n-1})] = S^{n-1}$$

$$\Rightarrow \alpha_{1,1} = \deg(g_{1,1}^n).$$

Example: $X =$

Cellular complex = $\{0 \longleftarrow \mathbb{Z} \xleftarrow{d_1} \mathbb{Z}^2 \xleftarrow{d_2} \mathbb{Z} \longleftarrow 0\}$

with $d_1 = [0 \ 0]$ and $d_2 = \begin{bmatrix} 2 \\ 2 \end{bmatrix} \Rightarrow H_* = \{\mathbb{Z}, \mathbb{Z}_2 + \mathbb{Z}, 0\}$

Theorem (Adams, 1956): Let X be a 1-reduced CW-complex
(one vertex, no 1-cell).

Then \exists a CW-model for the loop space ΩX ,
where every sequence $(\sigma_1, \dots, \sigma_k)$ of cells of X
of respective dimensions (d_1, \dots, d_k) generate
a cell of dimension $(d_1 + \dots + d_k - k)$ in the
CW-model of ΩX .

Examples:

$$S^3 = (*, 0, 0, 1) \Rightarrow \Omega S^3 = (*, 0, 1, 0, 1, 0, 1, \dots).$$

$$P^2\mathbb{C} = (*, 0, 1, 0, 1) \Rightarrow$$

$$\Omega P^2\mathbb{C} = (*, 1, 1, 2, 3, 4, 6, 9, 13, 19, 28, \dots).$$

6. The structure of second loop spaces

In Section 5 we showed that for a connected CW complex with no one cells one may produce a CW complex, with cell complex given as the free monoid on generating cells, each in one dimension less than the corresponding cell of X , which is homotopy equivalent to ΩX . To go further one should study similar models for double loop spaces, and more generally for iterated loop spaces.

In principle this is direct. Assume X has no i -cells for $1 \leq i \leq n$ then we can iterate the Adams–Hilton construction of Section 5 and obtain a cell complex which represents $\Omega^n X$. However, the question of determining the boundaries of the cells is very difficult as we already saw with Adams' solution of the problem in the special case that X is a simplicial complex with $sk_1(X)$ collapsed to a point. It is possible to extend Adams' analysis to $\Omega^2 X$, but as we will see there will be severe difficulties with extending it to higher loop spaces except in the case where $X = \Sigma^n Y$.

Translation: **No known algorithm** using these methods
computes $H_*(\Omega^n X)$ for $n \geq 3$
 except when X is an n -suspension $X = \Sigma^n Y$.

Typical example: $H_*(\Omega^3(P^\infty\mathbb{R}/P^3\mathbb{R})) = ???$

Adams: There exists a finite-type CW-complex
 with the homotopy type of $\Omega^3(P^\infty\mathbb{R}/P^3\mathbb{R})$.

Dimension	0	1	2	3	4	5	6	7	8	9	10	...
Cell-#	1	1	2	5	13	33	84	214	545	1388	3535	...

But **what about** the homological boundary matrices ???

Kenzo computing $d_5 : [C_5(\Omega^3) = \mathbb{Z}^{33}] \rightarrow [C_4(\Omega^3) = \mathbb{Z}^{13}] :$

===== END-MATRIX

Meaning:

Analysis of the **problem**:

“**Standard**” homological algebra is not **constructive**.

Typical statement:

The sequence $A \xleftarrow{\alpha} B \xleftarrow{\beta} C$ is exact.

Common translation:

$$(\forall b \in B) [(\alpha(b) = 0) \Rightarrow (\exists c \in C \text{ st } b = \beta(c))]$$

with $\exists c \in C$ most often **non-constructive**.

Constructive exactness:

$$A \xleftarrow{\alpha} B \xleftarrow{\beta} C \text{ constructively exact}$$

if an **algorithm** $\rho : \ker \alpha \rightarrow C$ is given satisfying:

$$\begin{array}{ccccc}
 A & \xleftarrow{\alpha} & B & \xleftarrow{\beta} & C \\
 \uparrow & & \uparrow & & \uparrow \\
 0 & \xleftarrow{\quad} & \ker \alpha & \xrightarrow{\rho?} & C
 \end{array}$$

(A red circle with an equals sign is placed between the second and third columns of the bottom row, and a red dashed arrow labeled $\rho?$ points from $\ker \alpha$ to C .)

\Rightarrow **Organizational algebraic problems:**

$$\begin{array}{ccccc}
 0 & \xleftarrow{\quad} & \mathbb{Z}/2\mathbb{Z} & \xleftarrow{\text{pr}} & \mathbb{Z} \\
 & & & \xrightarrow{\rho?} & \\
 & & & & \uparrow
 \end{array}$$

where ρ cannot be a group homomorphism.

Definition: A (homological) reduction is a diagram:

$$\rho: \boxed{h \circlearrowleft \widehat{C}_* \begin{array}{c} \xleftarrow{g} \\ \xrightarrow{f} \end{array} C_*}$$

with:

1. \widehat{C}_* and $C_* =$ chain complexes.
2. f and $g =$ chain complex morphisms.
3. $h =$ homotopy operator (degree +1).
4. $fg = \text{id}_{C_*}$ and $d_{\widehat{C}}h + hd_{\widehat{C}} + gf = \text{id}_{\widehat{C}_*}$.
5. $fh = 0$, $hg = 0$ and $hh = 0$.

Let $\rho: \boxed{h \hookrightarrow \hat{C}_* \begin{matrix} \xleftarrow{g} \\ \xrightarrow{f} \end{matrix} C_*}$ be a **reduction**.

Frequently:

1. \hat{C}_* is a **locally effective chain complex**:
its **homology groups** are **unreachable**.
2. C_* is an **effective chain complex**:
its **homology groups** are **computable**.
3. The **reduction** ρ is an entire description of
the **homological nature** of \hat{C}_* .
4. Any **homological problem** in \hat{C}_* is **solvable**
thanks to the **information** provided by ρ .

$$\rho: \boxed{h \circlearrowleft \hat{C}_* \begin{matrix} \xleftarrow{g} \\ \xrightarrow{f} \end{matrix} C_*}$$

1. What is $H_n(\hat{C}_*)$? Solution: Compute $H_n(C_*)$.

2. Let $x \in \hat{C}_n$. Is x a cycle? Solution: Compute $d_{\hat{C}_*}(x)$.

3. Let $x, x' \in \hat{C}_n$ be cycles. Are they homologous?

Solution: Look whether $f(x)$ and $f(x')$ are homologous.

4. Let $x, x' \in \hat{C}_n$ be homologous cycles.

Find $y \in \hat{C}_{n+1}$ satisfying $dy = x - x'$?

Solution:

(a) Find $z \in C_{n+1}$ satisfying $dz = f(x) - f(x')$.

(b) $y = g(z) + h(x - x')$.
